

Centennial Security.Suite

Centennial Security.Suite is designed to help dramatically improve an organization's ability to defend the network from both external and internal risks.

Providing effective solutions to the threats of:

- Operating system, network device firmware and application vulnerabilities
- Unauthorized removable media device connections
- Unwanted data transfers at network endpoints
- Potentially-dangerous 'greynet' applications on the network

Security.Suite benefits

Identify software & firmware vulnerabilities

Security.Suite compares an exact audit of the software and hardware against a comprehensive online database of vulnerabilities, alerting administrators to risks as they exist on your network and individual endpoints.

Benefit: Reduced risk of network downtime or external security breach, increased productivity through minimization of resources required to identify vulnerabilities.

Enforce removable media device & data transfer policies

Security.Suite allows administrators to build and enforce device use policies to control the use of portable devices on the network. All connections and data transfers are monitored and data can automatically be encrypted.

Benefit: Reduced risk of accidental or malicious data leakage, prevention of incoming malware and network infections from unauthorized devices, protection of data in transit.

Control greynet software

Not all software applications on the network should be there. Some are just a nuisance, while others represent a massive threat to the integrity of IT systems. Security.Suite uses a dynamic audit of the network to alert administrators to the presence of potentially-dangerous software.

Benefit: Reduced risk of network downtime, infection and malicious attack. Improves productivity by highlighting 'lifestyle' applications that require administrator attention.

How is Security.Suite different?

Unlike the vast majority of security solutions on the market, Security.Suite is based on having a persistent presence throughout your network. This enables our solution to identify and track every hardware device and piece of software installed across the organization, providing users with the ability to pinpoint risks across the network and undertake the appropriate remedial actions.

CENTENNIAL
software

Centennial Security.Suite Technology

Security.Suite combines the power of network discovery with the ability to control removable media and endpoint data transfers. Security.Suite is comprised of a number of industry-leading, award winning technology components that include:

Centennial Discovery

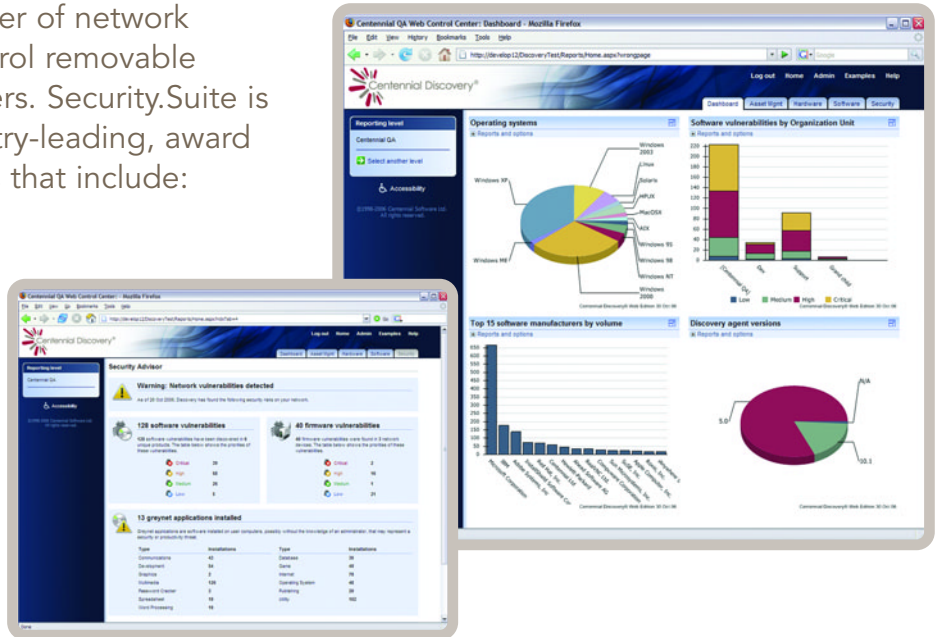

The first step in identifying the security risks across the IT environment is to know exactly what is on the network at any given moment. Centennial Discovery is unrivalled at finding, auditing and tracking all the hardware and software installed throughout the enterprise.

Centennial Discovery's advanced web reporting interface is perfect for allowing multiple authorized stakeholders around the business to get a view of their IT estates. It features a wealth of pre-canned and customizable reports designed to improve IT management and decision-making.

Security.Advisor

Taking the audit information recorded by Centennial Discovery, Security.Advisor then dynamically compares the hardware and software identified on the network against an extensive and up-to-date online database of current security risks.

Security.Advisor dramatically reduces the IT security team's workload by pinpointing security vulnerabilities such as application, OS and firmware vulnerabilities as well as 13 categories of greynet applications.

Centennial DeviceWall

DeviceWall is Centennial's multi award-winning endpoint security solution, which enables administrators to build a policy that allows or blocks device connections and data transfers according to the individual user's rights.

Fully-featured auditing and reporting enables managers to monitor the entire network for connections and data transfers. A seamless integration with Active Directory dramatically reduces the workload associated with policy management.

Discovery.Visual

Sometimes the best way to understand the security risks facing the organization is to see it graphically. That's exactly what users get with Discovery. Visual, as audit and security information are combined into a graphical view of the network. Administrators can pinpoint areas of high risk and understand the relationships between different assets and parts of the network.

Centennial Security.Suite also includes the ability to maintain a record of retired IT assets (Discovery.Archive) and access the unique online software information repository.

About Centennial Software

With more than six million licenses sold to over 6,000 customers worldwide, Centennial Software is a trusted developer of security and IT management solutions. Centennial's solutions are sold and supported by accredited partners in 42 countries.
